

## AI PROJECT HUB

# Forensic Projects

Live forensic systems for fraud analysis, tampering detection, malware detection, and fake-content verification.

### Forensic Track

Detection systems for fake media, manipulated content, identity checks, and fraud screening.

### Medical Track

Clinical prediction, imaging support, patient monitoring, and triage-oriented intelligence tools.

### Applied ML Track

Broader ML work for sports prediction, gesture systems, plant intelligence, and stock forecasting.

## CURRENT STRUCTURE

# Three domains. Cleaner navigation. Better project grouping.

This page is organized into forensic, medical, and applied machine learning tracks so every project sits inside a clearer and more realistic category.

### Domain-first navigation

Open a domain first, then go deeper into the relevant project cards for that area.

### Realistic presentation

Instead of random counters, the layout emphasizes use case, problem space, and project grouping.

### Built to grow

More cards, case studies, demos, or separate pages can be added without changing the layout direction.

# Forensic Projects

Live forensic systems for fraud analysis, tampering detection, malware detection, and fake-content verification.

IMAGE FORENSICS

## Image Forgery Detection using Copy-Move and Splicing

A web-based image forgery detector focused on copy-move manipulation and splicing-based tampering analysis.

MALWARE ANALYSIS

## Malware Detection System

A malware detection system built to identify suspicious software patterns and support faster security triage.

Malware Detection Software Analysis Threat Intelligence Security Triage

## How This Project Space Is Structured

This interface is designed like a domain hub instead of a generic portfolio. The purpose is to make your work look more practical and organized: first choose the field, then open the list of relevant systems, then later attach each card to a model demo, report, dataset, or GitHub repository.

### 01 Select a domain

The landing view keeps the choice simple with forensic, medical, and applied ML as the top-level paths.

### 02 Explore project cards

Each domain opens its own project list so the page stays clean and every card belongs to a meaningful category.

### 03 Expand into real outputs

Each card can later connect to a demo page, case study, results dashboard, PDF report, or deployment link.

## Recommended Next Additions

If you want this to feel even more production-ready, the next step is to attach evidence of work instead of only card names.

### Project detail pages

Add one page per card with problem statement, tools used, screenshots, results, and future scope.

### Model output previews

Show example predictions, confusion matrices, sample uploads, or report summaries inside each project.

### Deployment links

Connect the main buttons to Streamlit, Flask, React, or notebook-based demonstrations.

## Inside The Forensic Domain

This section groups your live forensic systems for financial fraud scoring, video tampering analysis, image forgery checks, synthetic voice detection, fake job screening, fake news detection, and malware analysis.

### Detection Layer

Projects focus on suspicious transactions, manipulated media, AI-generated voice, fake news verification, fraudulent job posting patterns, and malicious software detection.

### Model Layer

The stack combines hybrid ML, tampering analysis, copy-move and splicing detection, audio classification workflows, and malware detection logic.

### Output Layer

Each project is already connected to a live deployment so visitors can directly test the system.
